Longitudinal/Cross-Sectional Study of the Impact of Mathematics in Context on Student Performance

Teacher Background Data for 1999-2000 (Technical Report #26)

Thomas Romberg, Mary Shafer, Lori Folgert, Supiya Balakul, Chul Lee

University of Wisconsin-Madison

December 2002

Romberg, T. A., Shafer, M. C., Folgert, L., Balakul, S., & Lee, C. (2002) *Teacher background data for 1999-2000*. (*Mathematics in Context* Longitudinal/Cross-Sectional Study Tech. Rep No. 26). Madison, WI: University of Wisconsin, Wisconsin Center for Education Research.

The research reported in this paper was supported in part by the National Science Foundation #REC-9553889 and #REC-0087511. The views expressed here are those of the authors and do not necessarily reflect the views of the funding agency.

INTRODUCTION

The purposes of the longitudinal/cross-sectional study of the impact of *Mathematics in Context* (MiC; National Center for Research in Mathematical Sciences Education & Freudenthal Institute, 1997–1998) on student performance are (a) to determine the mathematical knowledge, understanding, attitudes, and levels of student performance as a consequence of studying MiC for over three years; and (b) to compare student knowledge, understanding, attitudes, and levels of performance of students using MiC with those using conventional mathematics curricula. The research model for this study is an adaptation of a structural model for monitoring changes in school mathematics (Romberg, 1987). For this study, information is being gathered on 14 variables over a 3-year period for three groups of students (those in Grades 7 and 8 in 1999). The variables have been organized in five categories (prior, independent, intervening, outcome, and consequent). (See Figure 1 for variables and hypothesized relationships.)

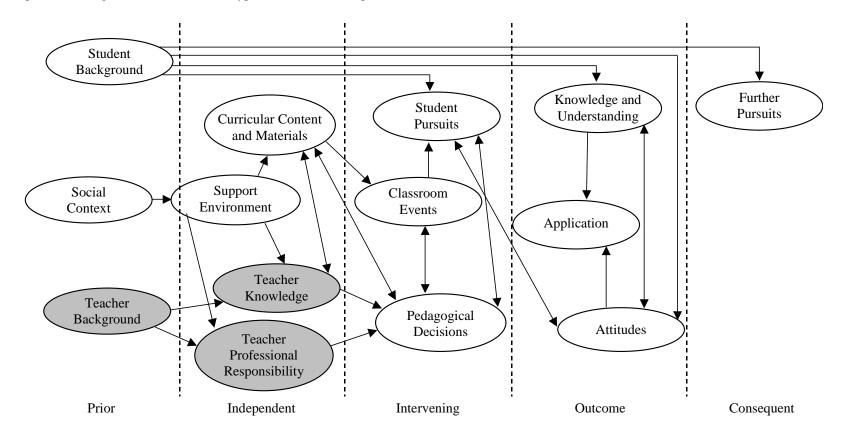

Figure 1. Revised model for the monitoring of school mathematics.

Overview: Teacher Background Data for 1999-2000

The purpose of this technical report is to summarize the information of the *Teacher Background* variable collected during spring and fall 1999¹ on teachers new to the longitudinal/cross-sectional study of the impact of *Mathematics in Context* on student performance. The purpose of gathering this information was to describe similarities and differences among the Grade 7 and Grade 8 study teachers. Characteristics for teachers at each grade level — sex, ethnicity, educational background, teaching experience, experience teaching mathematics, and experience teaching at the current school — were gathered via Teacher Questionnaire: Background and Experience (Shafer, Davis, & Wagner, 1997) and data about experience teaching *Mathematics in Context* were gathered via Teacher Questionnaire: Experience Teaching *Mathematics in Context* (Shafer, 1997). Information about each teacher's conceptions about mathematics teaching and learning and their assessment of student learning is gathered via Teacher Questionnaire: School Context (Shafer, Davis, & Wagner, 1997). (See Figure 2).

Fourteen seventh-grade teacher and 14 eighth-grade teachers from the 8 schools in four districts participated in the study. Districts are identified by number; school and teacher names are pseudonyms. Also noted are the type of materials used (MiC materials or a conventional text).

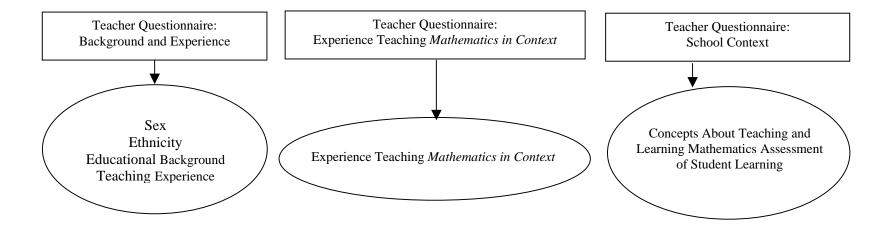

Figure 2. Teacher background characteristics in longitudinal/cross-sectional study of the impact of *Mathematics in Context* on student performance and their sources.

¹ Data in this report was collected from questionnaires teachers completed during the first year they participated in the study.

Characterization of Mathematics

Static

1. Mathematics is a collection of concepts and skills used to obtain answers to problems.

2. Mathematics is facts, skills, rules, and concepts learned in some sequence and applied in work and future study.

Dynamic

3. Mathematics is thinking in a logical, inquisitive manner and is used to develop understanding.

4. Mathematics is an interconnected logical system that is dynamic and changes as new problem-solving situations arise.

Table 5Mathematics Teaching and Learning, Seventh-Grade Teachers New to Study in 1999-2000, District 1, Part I

| | | | — Conventional — | | | |
| Fernwood-Hodge | Agree | Disagree | Agree | Disagree | Disagree | Agree |

Student Learning

- 1. Students learn best when they study mathematics in the context of everyday situations.
- 2. Students need to master basic computation facts and skills before they can engage effectively in studying more mathematics.
- 3. Students must learn basic skills before they can be expected to analyze, compare, and generalize.
- 4. Students learn mathematics best in classes where they are able to work in small groups.
- 5. If students use calculators, they won't learn the mathematics they need to know.
- 6. Students should write about how they solve mathematical problems.

Pedagogy

1. It is more important to cover fewer topics in greater depth than it is to cover the text.

2. More algebra, geometry, probability and statistics should be introduced in the elementary and middle school curriculum.

3. Instruction should include step-by-step directions.

4. Teaching a mathematical concept should begin with a concrete example or model.

5. In teaching mathematics, my primary goal is to help students master basic concepts and procedures.

6. Teachers should plan instruction based upon their knowledge of their students' understanding.

7. More emphasis should be given to simple mental computation, estimation, and less emphasis to practicing lengthy pencil-and-paper calculation.

8. Teachers should encourage children to find their own strategies to solve problems even if the strategies are inefficient.

9. Instruction should include many open-ended tasks.

10. Students should learn mathematics through regularly discussing their ideas with other students.

11. Mathematical problem solving should be a central feature of the elementary and middle school curriculum.

12. In my teaching I try to make connections among mathematical topics and between mathematics and other disciplines.

Characterization of Mathematics

Static

1. Mathematics is a collection of concepts and skills used to obtain answers to problems.

2. Mathematics is facts, skills, rules, and concepts learned in some sequence and applied in work and future study.

Dynamic

Mathematics is thinking in a logical, inquisitive manner and is used to develop understanding.
 Mathematics is an interconnected logical system that is dynamic and changes as new problem-solving situations arise.

Pedagogy

1. It is more important to cover fewer topics in greater depth than it is to cover the text.

2. More algebra, geometry, probability and statistics should be introduced in the elementary and middle school curriculum.

3. Instruction should include step-by-step directions.

4. Teaching a mathematical concept should begin with a concrete example or model.

5. In teaching mathematics, my primary goal is to help students master basic concepts and procedures.

6. Teachers should plan instruction based upon their knowledge of their students' understanding.

7. More emphasis should be given to simple mental computation, estimation, and less emphasis to practicing lengthy pencil-and-paper calculation.

8. Teachers should encourage children to find their own strategies to solve problems even if the strategies are inefficient.

9. Instruction should include many open-ended tasks.

10. Students should learn mathematics through regularly discussing their ideas with other students.

11. Mathematical problem solving should be a central feature of the elementary and middle school curriculum.

12. In my teaching I try to make connections among mathematical topics and between mathematics and other disciplines.

| (none) | | | | | | | | | | |

Pedagogy

1. It is more important to cover fewer topics in greater depth than it is to cover the text.

- 2. More algebra, geometry, probability and statistics should be introduced in the elementary and middle school curriculum.
- 3. Instruction should include step-by-step directions.
- 4. Teaching a mathematical concept should begin with a concrete example or model.
- 5. In teaching mathematics, my primary goal is to help students master basic concepts and procedures.
- 6. Teachers should plan instruction based upon their knowledge of their students' understanding.
- 7. More emphasis should be given to simple mental computation, estimation, and less emphasis to practicing lengthy pencil-and-paper calculation.
- 8. Teachers should encourage children to find their own strategies to solve problems even if the strategies are inefficient.
- 9. Instruction should include many open-ended tasks.
- 10. Students should learn mathematics through regularly discussing their ideas with other students.
- 11. Mathematical problem solving should be a central feature of the elementary and middle school curriculum.
- 12. In my teaching I try to make connections among mathematical topics and between mathematics and other disciplines.

Pedagogy

1. It is more important to cover fewer topics in greater depth than it is to cover the text.

2. More algebra, geometry, probability and statistics should be introduced in the elementary and middle school curriculum.

3. Instruction should include step-by-step directions.

4. Teaching a mathematical concept should begin with a concrete example or model.

5. In teaching mathematics, my primary goal is to help students master basic concepts and procedures.

6. Teachers should plan instruction based upon their knowledge of their students' understanding.

7. More emphasis should be given to simple mental computation, estimation, and less emphasis to practicing lengthy pencil-and-paper calculation.

8. Teachers should encourage children to find their own strategies to solve problems even if the strategies are inefficient.

9. Instruction should include many open-ended tasks.

10. Students should learn mathematics through regularly discussing their ideas with other students.

11. Mathematical problem solving should be a central feature of the elementary and middle school curriculum.

12. In my teaching I try to make connections among mathematical topics and between mathematics and other disciplines.

Importance of Student Performance in Determining Instructional Decisions and Grades, Type of Formal Assessment and Frequency of Use, Eighth-Grade Teachers in 1999-2000, District 4

| | Types of Formal Assessment | | | | | | | | | |
|--------------------|----------------------------|--------------------------|----------------------|----------------------------|----------------------|----------------------|--|--|--|--|
| School-Teacher | | Standardized Tests | | Classroom Projects | | | | | | |
